Comments on Collection 21-May-26 0739 F:
Diabetes is unlikely if fasting glucose levels are less than 5.5 mmol/L but
an OGTT could be indicated in the presence of risk factors such as
metabolic syndrome or family history of type 2 diabetes.

Comments on Collection 21-May-26 0739 F:
Hypercholesterolaemia noted in previous episode(s) with LDL cholesterol
between 5.0 and 6.4 mmol/L.
Secondary causes (e.g. hypothyroidism, cholestasis and nephrotic syndrome)
should be excluded.
In the absence of secondary causes, the possibility of familial
hypercholesterolaemia (FH) needs to be considered.
Clinical features of FH include tendon xanthomata and personal or family
history of premature atherogenesis.
Calculation of the likelihood of FH is available at
www.athero.org.au/fh/calculator

If not already undertaken, recommend specialist review and, for a patient with signs of premature or accelerated atherogenesis, consideration of Medicare rebated genetic testing for FH.

In patients with a first- or second-degree relative with a documented causative FH gene identified, genetic testing for FH is eligible for a Medicare rebate as a general practitioner request.

For further information, please also see www.sonicgenetics.com.au/fh

Please note that the above reference limits are decision limits. A flag based on these limits is an indication to review the absolute cardiovascular risk for the patient. For assessment of absolute cardiovascular disease risk please see www.cvdcheck.org.au

The above decision limits are based on the European Atherosclerosis Society (EAS) and European Federation of clinical Chemistry and Laboratory Medicine (EFLM) Consensus Statement 2016 and the Australasian Association for Clinical Biochemistry and Laboratory Medicine (AACB) Lipid Reporting Guideline 2018.

Lipid treatment targets for patients at high risk of cardiovascular disease:

Total cholesterol	<4.0 mmol/L
Triglyceride	<2.0 mmol/L
HDL cholesterol	>1.0 mmol/L
LDL cholesterol	<2.5 mmol/L (<1.8 mmol/L for very high risk)
Non-HDL cholesterol	<3.3 mmol/L (<2.5 mmol/L for very high risk)

High risk - Primary prevention Very high risk - Secondary prevention

Target values from the AACB Lipid Reporting Guideline 2018.

Please see NHFA-CSANZ ACS guideline 2025 for recommended LDL cholesterol target <1.4 mmol/L and conditions applying to therapy for abnormal lipid levels for very high risk.

Please note that as there is a continuum of risk, benefits are obtained for any measured lipid components moving towards and beyond the various target levels.

HIV Antigen and Antibody

HIV 1/2 Antigen and Antibody Negative
Comment on Lab ID 876893136

If serum was taken less than 3 months after exposure, this result may not exclude HIV-1/HIV-2 infection. Therefore another serum specimen should be tested after that time.

Vitamin D	82	74	81	70	(50-140)	nmol/L

Comments on Collection 21-May-26 0739 F:
According to the Position Statement 'Vitamin D and health in adults in Australia and New Zealand' MJA, 196(11):686-687, 2012, Vitamin D status is defined as:

Mild Deficiency	30	-	49 nmol/L
Moderate Deficiency	12.5	-	29 nmol/L
Severe Deficiency	<12.5		nmol/L

Vitamin D adequacy can be defined as a level >49 nmol/L at the end of winter - the level may need to be 10 - 20 nmol/L higher at the end of summer, to allow for seasonal decrease.
From 1st November 2014, Medicare rebates for vitamin D testing will apply to patients at risk of Vitamin D deficiency such as chronic lack of sun exposure.
